

Figure 3. Forest biomass estimated with tools from our existing carbon monitoring system. Aboveground biomass for (a) the West Cascades mapping region, (b) an area that experienced wildfire in 2003-2004, and (c) a localized area that experience both insect-related and fire mortality. (d) Time-series of biomass for three example locations (mean of 3 by 3 pixel window shown here), contrasting sites experienced insect mortality (brown and purple) with a site that only experienced fire.
